

Make the demo clear.

A practical guide to a three-minute product recording and the preliminary entry. No recording or submission is claimed by this guide.

THE STORY TO SHOW

Twelve units have no recorded lot. Lotline keeps them unresolved until a label check turns uncertainty into an answer. Then the team accounts for all 76 affected units.

PREPARE ONCE

1. Sign in and open a clean evaluation: 64 affected, 12 needing verification, 30 outside scope. All quantities refer to the synthetic fixture.
2. Confirm the source view shows catalog LL-SYR-10, lot SY2608-A, and return to the fictional supplier.
3. Copy the demonstration evidence text below into a scratch document so entry is quick. These are explicitly fictional records for the video, not evidence of real handling.
4. Rehearse the six actions - quarantine then return for each stock row of 40, 24, and 12 units. Reset to the clean evaluation before recording.
5. Record at desktop resolution with the fictional-data label visible. Hide notifications. Speak at about 130 words per minute and pause for state changes.

READ, THEN ACT

Read only the narration on pages 2-3. Screen directions are separate. Record every real action; shorten repetitive typing in the edit while keeping the visible state changes. The script leaves time for the six stock actions.

Verified locally: 48 core tests and 16 browser/API checks. These are engineering checks, not clinical or customer validation.

The caption file follows the planned three-minute timeline. Retiming to the recorded voice is expected; captions are not evidence that a video has been produced.

Read verbatim.

Part 1 of 2 | Show the uncertainty, review the notice, verify the twelve.

0:00 - 0:25 TWELVE UNITS WITHOUT AN ANSWER

SCREEN Show the overview. Point first to 64 affected, then 12 needing verification, then the missing-lot row.

A recall reaches a clinic. Sixty-four units match. But twelve more have no recorded lot. Are those twelve affected, or simply unknown?

I'm Shivam Gupta. This is Lotline, a recall-response workspace built around one question: can we account for every potentially affected unit?

0:25 - 0:50 REVIEW THE SOURCE

SCREEN Click **View source notice**. Show the fictional notice, catalog, lot, and permitted return action. Close the source view.

This is synthetic training data, with no patient information. We start from a human-reviewed notice: one product scope, exact lots, and the permitted disposition.

The source says return. Lotline enforces that choice. It will not accept destruction as completion of a return-only response.

0:50 - 1:20 RESOLVE THE TWELVE

SCREEN On the 12-unit row click **Verify label**. Set **Lot number** to SY2608-A. Enter verification evidence: SIMULATED label check: all 12 individual packages show SY2608-A. Click **Save verified label**. Pause on **76 affected** and **0 needing verification**.

Those twelve units stay unresolved until someone verifies their labels. For this demonstration, we record a simulated check: the labels show the affected lot.

Watch the totals change. We now have seventy-six affected units and zero needing verification. Missing information never became an automatic all-clear. It became a task with a recorded answer.

Finish the response.

Part 2 of 2 | Record the actions, inspect the evidence, explain the business test.

1:20 - 2:05 RECORD WHAT HAPPENED

SCREEN On the 40-unit row select **Record action**, choose **Quarantine / segregate**, enter quantity 40 and the evidence below, then **Save action**. Next select **Record return**, choose **Returned to supplier**, enter 40 and the return evidence, then **Save action**. Repeat for the 24-unit and 12-unit rows. Show the final total of 76 accounted for. Edit repetitive typing for pace; do not replace the real state changes with animations.

Next, we record quarantine and then return. Quantities must balance. We cannot record more stock than exists, or return more than has been quarantined.

We follow the same sequence for forty, twenty-four, and twelve units. Each action has a supporting reference. These are reported actions in a fictional exercise, not independent proof that real stock moved.

2:05 - 2:35 COMPLETE AND INSPECT THE EVIDENCE

SCREEN Select **Complete response**. Enter the final review text below in **Final review record**, check the attestation box for the fictional exercise, and choose **Complete and lock response**. Open **Evidence packet**, briefly show **Download evidence JSON**, **Export stock CSV**, and **Print / save PDF**. Open **Activity** to show the recorded history.

With all seventy-six units accounted for, we can complete the final review and lock this local response. That does not terminate a regulatory recall.

The evidence packet contains the scope, stock, recorded actions, and activity history. We can export the evidence, stock CSV, or a printable record.

2:35 - 3:00 THE BUSINESS EXPERIMENT

SCREEN Return to the completed overview. End with the product name and creator credit.

The first buyer hypothesis is a small US clinic group. Our pricing experiment is ninety-nine dollars monthly for up to three sites, plus nineteen per additional site. Willingness to pay is unvalidated.

Forty-eight core tests support this MVP. Next comes a supervised pilot measuring response time and stock accounting.

Lotline: every affected unit, every unresolved question, one reviewable response.

Paste-ready evidence.

These entries describe a fictional exercise. They do not certify real stock handling.

VERIFY LABEL - 12-UNIT ROW

Lot number: SY2608-A

SIMULATED label check: all 12 individual packages show SY2608-A.

40 UNITS

Quarantine: SIMULATED: 40 Riverside units segregated in training hold Q-001.

Return: SIMULATED supplier return receipt R-001: 40 Riverside units.

24 UNITS

Quarantine: SIMULATED: 24 Hillview units segregated in training hold Q-002.

Return: SIMULATED supplier return receipt R-002: 24 Hillview units.

12 UNITS

Quarantine: SIMULATED: 12 verified Hillview units segregated in training hold Q-003.

Return: SIMULATED supplier return receipt R-003: 12 verified Hillview units.

FINAL REVIEW RECORD

SIMULATED final review: 76 affected individual units are recorded as quarantined and returned. All four stock records and both fictional locations reviewed; no unresolved records remain. Thirty units are outside this reviewed scope. Training exercise only.

Complete response > Final review record > attestation checkbox > Complete and lock response. The attestation applies to this fictional evaluation only.

The sixty-second pitch.

Read every paragraph below verbatim. Counts refer only to the synthetic fixture.

A recall reaches a clinic. Sixty-four units match, but twelve have no recorded lot. Who makes sure those twelve are investigated?

I'm Shivam Gupta, creator of Lotline. We connect a reviewed notice to stock, keep incomplete identifiers unresolved, and follow quarantine and return through to a reviewable evidence packet.

In our synthetic demo, verifying those twelve labels changes sixty-four affected units to seventy-six. Nothing disappears behind an all-clear.

The initial buyer hypothesis is a small US clinic group. We would test ninety-nine dollars monthly for up to three sites, plus nineteen per additional site. That price and willingness to pay are unvalidated.

Forty-eight core tests support the MVP. Next comes a supervised pilot measuring response time and stock accounting.

Lotline turns a recall notice into a response someone can review.

DELIVERY NOTES

Pause after the opening question. Emphasize “twelve” and “unresolved.” Keep the pricing sentence matter-of-fact: it is an experiment, not a validated business. End on the product name.

The spoken paragraphs in this guide and the three-minute captions match the corresponding Markdown sources exactly, apart from line wrapping.

Before you submit.

Prepared materials are not an entry confirmation. Complete the organizer requirements first.

01 / ELIGIBILITY

Confirm current college or university enrollment, legal age, and geographic eligibility. Do not invent institution details. Sign in to Shivam's Devpost account and register.

02 / MANDATORY TEMPLATE

Obtain the genuine Hack2Heal 2.0 presentation template. The public pages mention it but exposed no download when checked. Transfer the prepared content without changing the prescribed structure. A custom deck is not a verified substitute.

03 / SIX REQUIRED SECTIONS

Problem Statement; Proposed Solution; Innovation & Technology; Target Users & Impact; Implementation Approach; Team Details.

04 / EXPORT AND INSPECT

Export the completed official-template presentation to PDF. Check every page, every link, the truthful team details, and AI/third-party acknowledgements. Rehearse the final demo and verify exports.

05 / SUBMIT AND CONFIRM

Enter the project through Devpost using the organizer's required upload mechanism. Verify that it is submitted, not merely saved as a draft. Keep the confirmation and final PDF.

DEADLINE: USE THE EARLIER PLATFORM CUTOFF

18 September 2026, 11:45 PM IST. The extension announcement states 11:59 PM; the platform states 11:45 PM. Submit well before the earlier time. September 18 ends the preliminary round. Final-round instructions go to shortlisted teams.

The three-minute recording is supporting material. The current public preliminary requirements mandate the official-template PDF and do not state that a video is required.

Official rules: hack2heal.devpost.com/rules | Schedule: hack2heal.devpost.com/details/dates | Extension: hack2heal.devpost.com/updates/46332-hack2heal-2-0-deadline-extended-to-18-september
